

■ User Manual – TeamsAutomation

1. What the application does

TeamsAutomation is an automation tool for Microsoft Teams that:

- Automatically creates a channel in a Team.
- Uploads a specified file into a channel.
- Posts a message in the channel with a link to the uploaded file.
- Logs all actions and errors into a log file (automation.log).

2. Planned functionalities (what it should do)

- ✓■ Channel creation.
- ✓■ File upload.
- ✓■ Posting a message in the channel.
- Adding members/guests to the Team does NOT work (missing Graph API permissions).
- Listing members and their roles does NOT work (missing Graph API permissions).

3. Installation and requirements

The application is written in C# (.NET 6+). To run it:

1. Clone or download the project.
2. Install the required packages:
dotnet add package Azure.Core
dotnet add package Microsoft.Graph
dotnet add package Microsoft.Graph.Core
dotnet add package DotNetEnv
3. Create a .env file in the project directory with the following content:
AZURE_TOKEN=
TEAM_ID=

4. Getting the keys

Token (AZURE_TOKEN): Obtain it from Microsoft Graph Explorer. Copy the Access Token value and paste it in the .env file.

TEAM_ID: Extract it from the Team link. Example:
<https://teams.microsoft.com//team/19:@thread.tacv2/conversations...>
Use the value between 'team/' and '@thread'.

5. The input.txt file

The application reads instructions from input.txt (must exist in the project directory).

Structure:

Channel Name
email_guest1@example.com
email_guest2@example.com
C:\path\to\file.pdf

First line → channel name

Lines 2..n-1 → list of guest emails

Last line → absolute path to the file.

6. The log file (automation.log)

All actions (successes or errors) are saved in automation.log:

- Channel creation or confirmation of existence.
- File upload and associated link.
- Errors that occurred during execution.

7. Running the application

1. Make sure .env and input.txt are properly configured.
2. Run: dotnet run
3. Check progress in the console and in automation.log.

8. Known limitations

Adding members and listing members require advanced permissions (Microsoft Graph API → Directory.ReadWrite.All, TeamMember.ReadWrite.All).

Since these were not granted, these functions are not active.
